Real Option Valuation of Product Innovation Yun Kang 2009-07 How can you evaluate a potential investment if there are several possibilities to change the course of action in the future depending on emerging situations? And even more challenging: How can you do so if you cannot come up with point estimates but you have to use several ranges of input values? Both - managerial flexibility as well as so-called continuous uncertainty - are highly relevant as they reflect most of the investment decisions realistically. But if you use standard valuation techniques like a simple Discounted Cash Flow model, the computed value will be significantly distorted, potentially prompting you to make a wrong decision. Given the practical urgent need for a suitable valuation technique, the real option valuation approach was developed as an advanced valuation approach. It follows a non-trivial but doable four-step process, quantifying the value of investments in terms of managerial flexibility and continuous uncertainty. While real option valuation is considered to be an advanced technique, Ms. Kang proves that it can be explained in an understandable way, even for someone approaching the matter with limited or no prior exposure to the topic. The author outlines the major issues of current innovation valuation with traditional valuation techniques. On the basis of this analysis she explains the concepts of valuing product innovation through the use of real option valuation. Supported by a few practical examples the author clarifies how to value different types of real options. So based on the actual Financial Statement 2006 of Research In Motion (RIM), the author develops a sample 5-year business plan for the innovation of BlackBerry 9900. This is done through the highly advanced model of Binomial Trees. Over the course of this thesis, you'll get a head-start into one of the more advanced management tools - the real option valuation.

[Real Option Valuation of Product Innovation](#) Yun Kang 2009-01-12 Inhaltsangabe:Abstract: Global competition, emerging technologies, and an ever increasing need for superior products in shorter timeframes contribute to drive companies to adopt new and innovative approaches to product innovation. Effective product innovation is imperative for the survival, growth and profitability of most design and manufacturing enterprises. In the current dynamic manufacturing environment, companies must innovate successfully if they wish to remain competitive. Product innovation is a complex, cross-functional and contingent, dynamic process, which is difficult to manage. Anticipating change and expeditiously responding to the dynamics of the business environment are important precursors for achieving sustainable competitive positions and exceptional performance. The heart of a product innovation is its value. Traditional discounted cash flow approaches (e.g. net present value (NPV), have traditionally been the preferred methods for evaluating investments in product innovation. The traditional NPV method, which was initially developed to value bonds or stocks by passive investors, implicitly assumes that corporations hold a collection of real assets passively. Managerial choices (e.g. delay, expand, switching etc.) are thus presumed to be limited to the initial decision. Therefore, traditional valuation methods undervalue the product innovation because they are unable to capture the value of managerial flexibility. Recently, real options emerged as an alternative to simplistic discounted cash flow methods. Real option valuation (ROV) values the managerial flexibility to make ongoing decisions regarding the implementation of investment projects and deployment of real assets. ROV extends valuation models used for financial options and applies them to investments in real assets. Black and Scholes developed the Black-Scholes model to value financial options that focus on factors affecting the value of the underlying financial asset over time. Proof by Cox, Ross, Rubinstein (1979), binomial tree model is simpler to understand for the practical and less elegant than Black-Scholes model. It uses the discrete mathematics to achieve the isomorphic result as the calculation used by Black-Scholes model. From an intuition point of view, the managerial flexibility is easier to understand. But, how much it is worth is most difficult or even impossible to think about and measure using traditional [...]

[North American Crop Wild Relatives, Volume 2](#) Stephanie L. Greene 2019-03-14 The plant species that humans rely upon have an extended family of wild counterparts that are an important source of genetic diversity to breed productive crops. These wild and weedy cousins are valuable as a resource for adapting our food, industrial and other crops to climate change. Many wild plant species are also directly used, especially for revegetation, and as medicinal and ornamental plants. North America is rich in these wild plant genetic resources. This book is a valuable reference that describes the important crop wild relatives and wild species found in Canada, the United States and Mexico. The book highlights efforts taken by these countries to conserve and use wild resources and provides essential information on best practices for collecting and conserving them. Numerous maps using up-to-date information and methods illustrate the distribution of important species, and supplement detailed description on the potential value these resources have to us, as well as their conservation statuses and needs. There is broad recognition of the urgent need to conserve biodiversity; however, a small fraction of wild species is distinguished by their potential to support agricultural production. Many of these species are common, even weedy, and are easily overshadowed by rare or charismatic plants. Nevertheless, because of their genetic proximity to agriculturally important crops or direct use, they deserve to be recognized, celebrated, conserved, and made available to support food and agricultural systems. This comprehensive two-volume reference will be valuable for students and scientists interested in ecology, botany, and for practitioners at all levels tasked with conserving plant biodiversity.
